

FITZO

Launch-Readiness Plan

Gap inventory + 6-week execution plan, structured for a two-person split (Dilip + Jay).

Prepared: 14 July 2026 | Basis: full code + docs/PROGRESS.md audit, live DB state, money-flow audit of the same day

Decision locked (14 Jul 2026)	Choice
Launch ambition	Soft launch in ~4-6 weeks - real customers in one city area, test-scale ops
Business / legal status	Nothing registered yet - entity + GST + Razorpay live KYC all start now (critical path)
Hosting	Netlify (chosen family: Netlify/Cloudflare; Netlify recommended for Next.js 15 App Router)
v1 scope	CUT: AI skin-tone styling (sweep placeholders). KEEP: delivery-slot booking + coupons - both in lean shapes (defined in Week 3)
Cart model	Single store per order (v1) - the Swiggy/Zomato pattern. One order = one store = one pickup = one rider trip. Multi-store carts are logically broken today (G1)
Delivery fee policy	Fee collected UPFRONT at checkout (own small Razorpay payment - collected on keep AND return), with config waivers: first order free + auto-refund when kept value >= threshold . Closes G8 + G9; adds commitment against abuse (G5)

The one-line read

The product loop is **built and live-fire verified** (customer order -> store confirm -> rider offer/claim -> doorstep OTP -> try window -> keep/pay via Razorpay -> payout ledgers). What does not exist yet is **the company around it**: no deploys, no environments, no legal entity, no live payments, no monitoring, no CI, one shared database holding test and 'production' data together - and a delivery business whose checkout does not collect a street address.

How to use this document

Section 1 lists every gap found, with IDs (A1, B3, ...) used throughout. Section 2 is the money-model plan (from the 14 Jul audit). Section 3 is the week-by-week plan where every task carries a **suggested owner**: **D** = Dilip, **J** = Jay, **D+J** = shared. The suggested split follows existing ownership: Dilip owns Razorpay + money flow (decision of 11 Jul 2026), infra/migrations, and the admin panel; Jay historically owns the customer loop and agent panel. Re-split as you like - the dependency column is what actually constrains order.

Working rules (unchanged): feature branches only; migrations numbered from 043, idempotent, listed in PROGRESS Known-issues until applied; money moves only through Razorpay; RLS / guarded-RPC discipline; never run 'next build' while a dev server runs; each task ends with typecheck + builds + a PROGRESS entry.

#	Section	What it covers
1A	Product gaps	Launch-blocking correctness gaps in the customer/store/agent/admin apps
1G	Business-logic flaws	The 'not vibe-coded' audit: places where the flows are wired but the LOGIC is wrong (multi-store orders, client-trusted prices, no stock, ...)
1B	Infrastructure gaps	Environments, hosting, CI, monitoring, email/SMS - none exist today
1C	Business / legal gaps	Entity, GST, Razorpay live KYC, DLT - longest lead times, zero code
1D	Security hardening	Admin 2FA, RLS regression tests, rate limits, secrets
1E	Money & margins	6-step plan to make the numbers decision-grade (audit of 14 Jul)
1F	Deferred backlog	Explicitly post-launch items - agreed cuts and sensible deferrals
2	Money plan detail	Steps, sizes, and the two owner decisions still open
3	6-week plan	Week-by-week tasks with owners + dependencies
4	Work split summary	Dilip's lane vs Jay's lane at a glance
5	Checklists & risks	Business checklist, launch-day checklist, top risks

What is already DONE (do not redo)

All 4 panels built (customer 25 screens ex-slots/AI; store 14/14 incl. self-serve onboarding + approval; agent rebuilt real-world with OTP handover, 1-job cap, PII redaction, PWA; admin 20/21 with security lockdown, audit log on every mutation, needs-attention dashboard). Money Track A complete (migrations 037-042, all applied): rider pay decoupled from customer delivery fee; payment.captured webhook settling in-DB; delivery fee collected on first Keep; admin Razorpay refunds; traceable manual payout ledgers (UTR + destination snapshot). Full three-panel E2E browser-verified 12 Jul on order FTZ-2026-00051.

1A. Product gaps - launch blockers

ID	Gap	Detail / evidence	Sev.
A1	Checkout collects only a pincode - no street address	Riders get 'Address on file / demo order'. Fatal for a doorstep business. The addresses table + admin display already exist; checkout must render an address form and write the row. File: apps/customer/components/cart/CheckoutPageView.tsx	P0
A2	Delivery-slot booking missing (customer screen #8)	Copy promises slot booking; no UI exists. KEPT in v1 scope -> lean shape: date + 2-3 time windows chosen at checkout, shown on store order + rider offer/detail. No capacity engine in v1.	P0
A3	Try-window config three-way inconsistent	checkout/actions.ts hardcodes 7 min; live system_settings.try_window_minutes = 60; rider-arrival flow resets the deadline. Single source of truth = system_settings, read at the arrival reset; checkout placeholder should read it too.	P0
A4	Coupons are decorative	Coupon UI card exists but placeOrder hardcodes discount 0; admin Coupons manager writes rows nothing reads. KEPT in v1 -> lean shape: percent/flat codes validated at checkout, stamped into orders.discount columns; decide who funds the discount (commission base) - see money step M3.	P1
A5	Stale / false copy	Footer still lists COD (removed from checkout); 'Pay Later' maps to a wallet that does not exist; AI skin-tone placeholders must go (agreed cut): product-detail badge, /ai-style-setup page, nav references.	P1
A6	No notifications outside the app	Customer who closes the tab learns nothing. v1 minimum: transactional email (order confirmed, rider on the way, payment receipt, refund issued) via custom SMTP provider. SMS/WhatsApp post-launch.	P1

Sev. P0 = cannot launch without; P1 = launch looks broken/unprofessional without; P2 = soon after.

1G. Business-logic flaws - the 'not vibe-coded' audit (added 14 Jul)

Flows that are wired end-to-end but whose LOGIC is wrong for a real business. Every item below was verified in code, not guessed. G1 and G2 are non-negotiable P0s.

ID	Flaw	What actually happens today / the fix	Sev.
G1	Multi-store orders are operationally impossible	A cart can mix stores, but ONE delivery is created with pickup_address = the FIRST store (033 stamps store_count for display only). The rider can never collect store B's items - yet they sit in the try session and can be 'kept'. Worse: pickup is gated on ALL items prepared, so if store B never confirms, the whole order jams until the 120-min expiry cancels it. FIX (decided): single-store cart v1 - adding an item from another store prompts 'replace bag?'; placeOrder rejects mixed carts server-side as the backstop.	P0
G2	Checkout trusts the CLIENT's price	placeOrder inserts price_at_order = item.priceValue straight from the browser (checkout/actions.ts:127), and the Keep charge later reads price_at_order as truth. A tampered request buys a Rs.5,000 item for Rs.1 - real money loss, trivially scriptable. FIX: resolve price server-side from products/variants at placement (discounted_price ?? base_price), ignore the client number, and reject if it drifted from what the customer saw (show refreshed price).	P0
G3	No stock check, no stock movement	Variants carry stock_qty/available_qty and the PDP filters on them, but placeOrder never checks stock, never decrements, and its fallback will happily pick an out-of-stock variant. Two customers can order the last unit; items out on a try-run are still 'available'. FIX: place the order through an RPC that locks variants, verifies availability, decrements available_qty; restore on return/cancel/expiry.	P0
G4	Customer cannot cancel an order	Only admin cancel + the staleness sweep exist; a customer who ordered by mistake must phone support or wait 2 hours for expiry (which reads as 'no rider found' - wrong message). FIX: customer Cancel on tracking page while status is pending/confirmed-and-unclaimed, via guarded RPC (frees stock per G3, notifies the store).	P1
G5	Zero commitment at checkout = free abuse	No payment, no deposit, no caps: anyone can order 10 items to their door repeatedly, return everything, and each round costs Fitzo two rider trips + store handling. FIX v1: config caps (max items/order, max active orders per customer = 1, optional daily order cap), enforced server-side; deposits/holds stay a post-launch option.	P1
G6	Stores have no hours, no serviceability check	A store anywhere on earth can onboard and its products are orderable by a Pune customer (the pincode gate only checks the CUSTOMER side); orders can ring a closed shop at 2am and sit until expiry. FIX: pickup-pincode serviceability check at admin approval; a store open/paused toggle (dashboard header) that hides products / blocks new orders while paused. Full hours schedule = post-launch.	P1
G7	Fake reviews presented as real	/reviews renders mockData testimonials under the heading 'Real reactions from people...'. Fabricated social proof is a trust (and legal) problem. FIX: park the page for v1 (folded into the W3.3 copy sweep); real reviews are post-launch.	P1
G8	Free-delivery threshold judged on ORDERED value, not kept	Order Rs.1,000+ (fee waived at checkout), keep one Rs.399 tee -> no delivery fee is ever charged, though the trip happened. CLOSED BY G9: the waiver moves to KEPT value, evaluated at settle time.	P2

ID	Flaw	What actually happens today / the fix	Sev.
G9	Delivery fee only ever collected on a KEEP - 'return everything' rides free	Migration 040 folds the fee into the FIRST Keep charge, so a customer who returns everything pays Rs.0 while Fitzo still pays the rider (Rs.40) + store handling - a guaranteed loss on every browse-only order, stacking with G5 (no caps). FIX (config-driven policy in system_settings, supports all three owner options): (a) collect the fee UPFRONT at checkout as its own small Razorpay payment - fee lands whether they keep or return, and doubles as commitment against G5; (b) first_order_free toggle - first-time customers ride free (acquisition); (c) free-delivery waiver moves to KEPT value - kept >= free_delivery_above at settle auto-refunds the fee payment (reuses the 041 refund plumbing on the standalone fee payment; also closes G8). Composes cleanly with 040: its 'fee already carried by a successful payment?' check sees the upfront payment and stops folding the fee into the first Keep automatically. Trade-off to confirm at build time: upfront fee adds a payment step to today's zero-payment checkout - which is also the point. Weaker alternative (rejected): billing the fee at window-end when all items return is unenforceable in-app.	P1

1B. Infrastructure gaps - all of it is missing

ID	Gap	Detail	Sev.
B1	One Supabase project is dev AND prod	E2E fixtures, test riders, 50 test orders live beside future real data. Split into prod + dev projects BEFORE any real customer. Prod gets clean schema + only real stores/riders.	P0
B2	Migrations are hand-pasted SQL	042 files applied by pasting into the SQL editor. Adopt supabase CLI migration flow; the B1 split is the natural moment to baseline (single consolidated schema) so prod is reproducible.	P0
B3	Zero deploys / domains / SSL	4 Netlify sites from the monorepo (base dir per app), per-app env vars (service-role key ONLY on admin site), fitzo.in + agent.store/admin. subdomains, staging aliases, preview deploys per PR.	P0
B4	No CI	No .github/workflows. Add GitHub Actions: pnpm -r typecheck, lint, vitest, 4 builds on every PR; block merge on red. Add the RLS probe suite (D3) once it exists.	P0
B5	No error monitoring / uptime / analytics	Sentry on all 4 apps (client + server), a simple uptime check on the 4 domains + the Razorpay webhook route, PostHog or Plausible on the customer app.	P1
B6	Supabase built-in auth email sender	Hard-limited (~3-4 emails/hour) - signup breaks on day one. Configure custom SMTP (Resend/Brevo) + domain email (support@fitzo.in). Also carries A6 transactional mail.	P0
B7	Phone OTP not production-ready for India	Needs an SMS provider (MSG91/Twilio) + DLT registration (days-to-weeks lead time). Start registration NOW or soft-launch with email+password only and add OTP when DLT clears.	P1
B8	No backups / no scheduled sweeps	Enable PITR or scheduled dumps on the prod project; schedule pg_cron sweeps already written in migrations 027 (expire_try_windows) + 036 (expire_stale_offers).	P1

1C. Business / legal gaps - start the clocks first

Nothing is registered. These items gate ALL live money and cannot be coded around. They are wall-clock time, not work time - start them in Week 1 and chase weekly.

ID	Item	Detail / lead time	Gates
C1	Entity registration	Proprietorship = fastest path to Razorpay live; Pvt Ltd = cleaner for investors + RazorpayX later. This is a CA question - book the CA call in Week 1. Lead: days (proprietorship) to ~2-3 weeks (Pvt Ltd).	C3, C4, E-step M4
C2	GST registration	E-commerce operator obligations (TCS) and commission invoicing need it; CA advises timing. Lead: ~1-2 weeks after entity.	Tax provisions (M4)
C3	Razorpay LIVE KYC	Needs entity docs + bank in entity name + website with terms/privacy/refund pages (pages already exist in the customer app). Lead: ~2-5 working days once docs are ready.	Any real payment
C4	Live keys + live webhook + secret rotation	Swap test->live keys in customer + admin envs, re-create the Vault secrets, register the live webhook (payment.captured), and ROTATE the leaked test secret (still pending from Track A). Also finish the two pending test-mode dashboard steps meanwhile: 039 webhook + refund credits.	Live cutover (W5)
C5	RazorpayX payouts - stays manual	Blocked on registered entity + its own KYC (see docs/PAYOUTS-GOING-LIVE.md). Launch plan = manual UTR-referenced payouts via the 042 ledger on a weekly cadence. Automate post-launch.	Nothing (accepted)
C6	SMS DLT registration	Required for OTP/transactional SMS in India; register entity + templates with an operator via MSG91/Twilio. Lead: days-to-weeks. Decision B7 depends on it.	Phone OTP at launch

1D. Security hardening (pre-launch pass)

ID	Gap	Detail	Sev.
D1	Admin has no 2FA	Spec requires it. Lean path: Supabase native TOTP MFA enrollment forced for role=admin + an email allowlist check in the admin login/middleware.	P0
D2	Secrets hygiene at deploy	Service-role key exists ONLY in the admin site env; anon keys elsewhere; Razorpay secrets server-side only; audit .env.example files; rotate anything ever shared in chat.	P0
D3	No RLS regression tests	The 08 Jun incident (RLS silently disabled -> anon could read all PII) must never recur unnoticed. Automated anon-key probe against every table + a couple of cross-tenant probes (store A reading store B), running in CI against dev, and on demand against prod.	P0
D4	Auth settings review	Rate limits on auth endpoints, redirect URL allowlist per real domain, leaked-password protection on, OTP expiry sane. One sitting in the Supabase dashboard, per project.	P1

1E / 2. Money & margins - the 6-step plan (audit of 14 Jul)

Track A made cash movement correct; this makes the ACCOUNTING truthful. Headline findings: (1) 'revenue' on the dashboard/analytics is checkout-time GMV incl. returned items - the only true number is captured minus refunded; (2) Razorpay gateway fees (~2% + 18% GST on the fee) are invisible, overstating every margin (~15% on the E2E test order); (3) refunds reverse cash but NOT commission/store-payout/margin - a fully refunded order still shows 'store payout owed'; (4) zero tax modelling (GST on commission, TCS, TDS 194-O); (5) commission is read live from settings, never stamped - changing the rate rewrites history; (6) the money math is triplicated (Money card / payouts compute / store earnings) with 'must mirror' comments.

Step	What	Size	Owner	When
M1	Gateway-fee capture (migration 043): payments.gateway_fee/gateway_tax stamped by the 039 webhook RPC + confirm path; admin 'sync fees from Razorpay' backfill for the 10 existing rows	S	D	Week 1
M2	order_economics SQL view (044): per-order captured / refunded / net revenue / kept-and-paid gross / commission / store net / rider cost (gated on completion) / fee collected / gateway cost / margin. Repoint Money card, both payout computes, store Earnings, dashboard, analytics onto it - kills findings 1, 3 and 6 in one move	M	D	Week 1-2
M3	Commission stamped at settlement (045): rate + amount per kept item inside settle_keep_payment; optional stores.commission_rate override; settings rate = default for NEW transactions only. Coupon commission-base rule lands here	M	D	Week 3
M4	Tax provisions (046): GST-on-commission / TDS / TCS rates + enable toggles in settings; payout screens show gross -> commission -> GST -> TDS -> net; components snapshotted on ledger rows. Becomes real when C2 lands	M	D	Week 4-5
M5	Admin Finance / P&L; screen: date-ranged P&L; + per-order contribution table + honest CSV export, reading order_economics	M	D	Week 5-6 (can trail)
M6	Settlement reconciliation: import Razorpay settlements via API, match to payments, flag gaps. Needs live-mode settlement volume	M	D	Post-launch

Two owner decisions still open (needed before M2/M4): (1) Refund semantics - recommendation: accounting-only (item stays 'kept'; revenue/commission/payout basis excludes refunded payments). (2) Tax posture - recommendation: provision/display-only until GST registration exists, then decide withholding with the CA.

1F. Deferred - explicit post-launch backlog

AI skin-tone endpoint + UI (CUT from v1; placeholders swept in W3). RazorpayX / Route payout automation (C5). Maps/geo + rider distance + nearby-only offers. Server-side pagination in admin (pre-scale item). CMS (content_blocks has zero consumers - parked). WhatsApp/SMS order notifications. Native apps. Settlement reconciliation (M6). Slot capacity management (v1 slots are simple windows). Store payout self-serve statements. 2FA for store/agent panels (admin first).

3. The 6-week plan

Owners: D = Dilip, J = Jay, D+J = shared. Dependencies use gap/step IDs. Business items (C*) are 'start and chase' - they run in parallel the whole time.

Week 1 - start the clocks + the biggest product gap

Everything with a lead time starts now; code attacks the worst correctness gap.

Task	Detail	Owner	Depends on
W1.1 CA call + entity registration filed	Decide proprietorship vs Pvt Ltd with the CA; file same week. Also ask: GST timing (C2), tax posture for M4.	D+J	C1
W1.2 SMS/DLT + SMTP signups	Create MSG91 (or Twilio) account, start DLT registration (C6). Create Resend/Brevo account + verify fitzo.in domain for email (B6).	J	C6, B6
W1.3 Address at checkout	Real address form (line1/line2/landmark/city/pincode/phone) -> addresses row -> stamped on order; rider drop card + admin already read it. Keep the Pune-pincode gate.	J	A1
W1.4 Server-side pricing (CRITICAL)	placeOrder resolves price from products/variants in the DB, ignores client priceValue; validates product is_active/not-deleted + store approved. Same file as W1.3 - do together. D reviews the PR (money-critical).	J	G2
W1.5 Try-window single source of truth	Checkout + arrival reset + customer countdown all read system_settings.try_window_minutes; delete the hardcoded 7. Confirm intended live value (currently 60).	J	A3
W1.6 Money M1 - gateway fees	Migration 043 + webhook/confirm stamping + admin backfill sync.	D	M1
W1.7 Money M2 started - order_economics view	Migration 044 draft + repoint the admin Money card first.	D	M2, M1

Week 2 - environments + pipeline (the 'become a real deployment' week)

No new features. At the end of this week Fitzo exists on the internet (staging) and prod data is clean.

Task	Detail	Owner	Depends on
W2.1 Supabase prod/dev split	New prod project; baseline schema via supabase CLI from consolidated migrations; seed ONLY real config (system_settings) - test fixtures stay in dev. Document the flow in docs/.	D	B1, B2
W2.2 Netlify: 4 sites + staging domains	Monorepo base dirs, per-app env vars (service-role ONLY on admin), staging subdomains, PR preview deploys.	J	B3
W2.3 GitHub Actions CI	typecheck + lint + vitest + 4 builds on PR; branch protection on main.	J	B4
W2.4 Custom SMTP live	Supabase auth mail via Resend/Brevo on BOTH projects; support@fitzo.in works.	J	B6, W1.2
W2.5 Sentry + uptime	All 4 apps, source maps in CI; uptime pings on the 4 staging domains + webhook route.	J	B5
W2.6 Single-store cart	Cart provider: adding an item from a different store prompts 'Replace bag?'; placeOrder rejects mixed-store carts server-side as backstop; copy explains why ('one shop, one rider, one doorstep').	J	G1
W2.7 Money M2 finished	Payout computes, store Earnings, dashboard, analytics all read order_economics; refund-aware numbers verified against FTZ-2026-00051.	D	M2

Task	Detail	Owner	Depends on
W2.8 Stock reservation RPC	placeOrder goes through a guarded RPC: lock variants, verify available_qty, decrement; restore on return/cancel/expiry sweeps. Migration numbered next in sequence.	D	G3
W2.9 Backups + pg_cron on prod	PITR/dumps enabled; schedule 027 + 036 sweeps.	D	B8, W2.1

Week 3 - the kept scope + copy truth

The two features you chose to keep, in lean shapes, plus the copy sweep.

Task	Detail	Owner	Depends on
W3.1 Lean slot booking	Checkout: pick date (today/tomorrow) + time window (e.g. 12-3 / 3-6 / 6-9); stamped on order; shown on store order card, rider offer + detail, admin orders. Migration for slot columns. NO capacity engine.	J	A2, W1.3
W3.2 Lean coupons	Validate code at checkout against admin coupons table; stamp discount into orders.discount_amount/coupon_*; keep-payment math + commission base rule agreed with D (who funds the discount).	J	A4, M3
W3.3 Copy sweep	COD out of footer; 'Pay Later'/wallet hidden; AI skin-tone badge + /ai-style-setup + nav refs removed; FAKE REVIEWS page parked (G7); how-it-works matches the real flow incl. slots + single-store carts.	J	A5, G7
W3.4 Money M3 - commission stamping	Migration 045; settle_keep_payment stamps rate+amount; payables read stamped values; optional per-store rate.	D	M3, M2
W3.5 Admin MFA + allowlist	Supabase TOTP enrollment forced for admins; email allowlist in middleware/login.	D	D1
W3.6 Delivery-fee policy rework	Fee becomes its own upfront Razorpay payment at checkout (reuses keep-payment plumbing + webhook settle; 040's fee-carried check then auto-skips folding it into the first Keep). system_settings gains first_order_free toggle + waiver basis = KEPT value (kept >= free_delivery_above at settle -> auto-refund the fee payment via the 041 path). Migration claims next free number. D owns money path; J wires the checkout payment step UI.	D+J	G9, G8, M2

Week 4 - security, trust, and the test net

Make it safe to put strangers and real money through it.

Task	Detail	Owner	Depends on
W4.1 RLS probe suite in CI	Anon-key probe over every table + cross-tenant checks (store A vs B, rider A vs B); fails CI loudly. Run against dev in CI; runnable on prod by hand.	D	D3, W2.3
W4.2 Transactional emails	Order confirmed, rider on the way (store-confirm/claim), payment receipt, refund issued - triggered off existing notification points; templates on the SMTP provider.	J	A6, W2.4
W4.3 Playwright E2E happy path	One scripted run of the full loop against staging (order -> confirm -> claim -> OTP -> keep/pay test-mode -> payout visible). Nightly + pre-release.	J	W2.2
W4.4 Auth settings pass	Rate limits, redirect allowlists, leaked-password protection - both Supabase projects.	D	D4
W4.5 Customer cancel	Cancel button on tracking while pending/confirmed-and-unclaimed; guarded RPC frees stock (W2.8), notifies store, honest copy (not 'no rider found').	J	G4, W2.8

Task	Detail	Owner	Depends on
W4.6 Abuse caps	system_settings: max items/order, max active orders per customer (default 1), optional daily cap - enforced in the placeOrder RPC.	J	G5, W2.8
W4.7 Store serviceability + pause toggle	Admin approval checks pickup pincode is serviceable; store dashboard gains Open/Paused toggle - paused hides products + blocks new orders.	D	G6
W4.8 Money M4 - tax provisions	Migration 046 + payout waterfall UI; toggles OFF until GST exists; CA-reviewed rates.	D	M4, C2
W4.9 Secret rotation	Regenerate the leaked Razorpay test secret (both apps + Vault); verify webhooks still settle.	D	C4

Week 5 - production cutover

The critical-path week. If Razorpay live KYC hasn't cleared, everything else still proceeds; payments stay test-mode until it does.

Task	Detail	Owner	Depends on
W5.1 Domains live	fitzo.in + agent./store./admin. on Netlify prod sites, SSL, envs pointed at prod Supabase.	J	W2.1, W2.2
W5.2 Razorpay live cutover	Live keys both apps, live Vault secrets, live webhook registered, refund credits checked. GATED ON C3.	D	C3, C4
W5.3 Seed real operations	Real stores onboarded + approved; real rider(s) verified with payout details; system_settings reviewed (fees, commission, try window, slots).	D+J	W2.1
W5.4 Live dry-run	One real order end-to-end on prod with a small live payment + a live refund; verify money card, ledgers, gateway fees, emails.	D+J	W5.2
W5.5 Ops runbook	docs/RUNBOOK.md: stuck delivery (release/fail), refund flow, webhook down, payout cadence (weekly, UTR ledger), support SLA, who's on call.	D	-

Week 6 - buffer + soft launch

Nothing new lands this week. Friends-and-family first, then the small circle.

Task	Detail	Owner	Depends on
W6.1 Soft launch	Invite list -> first real orders; both of you watch Sentry + admin needs-attention queue live during delivery windows.	D+J	All P0s
W6.2 Money M5 - P&L; screen	Lands whenever; trails the launch safely.	D	M5
W6.3 Triage + fix	The week's real job: whatever the first ten orders break.	D+J	-

4. Work split at a glance

Dilip (money / infra / admin)	Jay (customer / agent / growth surface)
Money steps M1-M5 (migrations 043-046): gateway fees, order_economics, commission stamping, tax provisions, P&L;	Address at checkout (A1) + try-window wiring (A3)
Stock reservation RPC (G3) + store serviceability/pause (G6) + delivery-fee policy money path (G9)	Server-side pricing (G2, D reviews) + single-store cart (G1) + customer cancel (G4) + abuse caps (G5) + fee-payment checkout UI (G9)
Supabase prod/dev split + CLI migration baseline + backups + pg_cron (B1/B2/B8)	Netlify 4 sites + staging/prod domains + CI + Sentry/uptime (B3/B4/B5)
Admin MFA + allowlist (D1), RLS probe suite (D3), auth settings (D4), secret rotation (C4)	SMTP + transactional emails (B6/A6), SMS/DLT signup (B7/C6)
Razorpay live cutover (C3/C4, W5.2), refund credits, webhook	Lean slot booking (A2), lean coupons (A4), copy sweep (A5)
Ops runbook + payout cadence (C5)	Playwright E2E (W4.3)
Business chase: CA/entity/GST (with Jay)	Business chase: DLT/SMS + email domain (with Dilip)

Rationale: Dilip owns Razorpay + money flow (11 Jul decision), has been doing all migrations/DB work, and owns the admin panel. Jay owns the customer loop + agent panel historically. Shared items are marked D+J in Section 3. Swap anything - just keep the dependency order.

5. Checklists & risks

Business checklist (start Week 1, chase weekly)

Item	Status today	Target
CA engaged; entity type decided	Not started	Week 1
Entity registered + PAN + bank account in entity name	Not started	Week 2-3
GST registration filed	Not started	Week 3-4 (CA timing)
Razorpay live KYC submitted	Not started (test mode only)	As soon as entity docs exist
Razorpay live KYC approved -> live keys	-	Week 5 target (critical path)
DLT registration for SMS	Not started	Week 4-5; else email-only launch
Test-mode chores meanwhile: 039 webhook in dashboard, refund credits top-up, rotate leaked test secret	Pending (Track A leftovers)	Week 1-2

Launch-day gate (all must be green)

#	Gate
1	Prod Supabase project only contains real data; RLS probe suite passes against prod
2	4 domains live on Netlify, Sentry quiet, uptime green for 48h
3	Checkout collects a full street address; slots visible to store + rider
4	A live-mode order completed end-to-end incl. a live refund (W5.4)
5	Transactional emails deliver (confirm / on-the-way / receipt)
6	Admin MFA on; service-role key nowhere but the admin site; leaked secret rotated
7	Runbook written; payout cadence agreed; support phone/email real
8	Money card / Earnings / Payouts / P&L; agree with each other on the dry-run order

#	Gate
9	Prices resolved server-side (G2), single-store cart enforced (G1), stock decremented on order (G3) - verified by tampering attempts against staging
10	Delivery fee collected upfront incl. on a return-everything order; first-order-free and kept-value auto-refund waivers verified on the dry-run (G9)

Top risks

Risk	Why it bites	Mitigation
Razorpay live KYC slips	Only item you cannot code around; everything money waits on it	File entity Week 1; submit KYC the day docs exist; chase weekly; launch CAN go ahead in test-mode-for-friends if needed, but no real money
Slot booking + coupons both in a 6-week window	Scope creep risk in Week 3, and the G-series added real work to Weeks 1-4	Lean shapes only (defined above). Bump order if weeks run hot: coupons first, then abuse caps (G5), then store pause (G6). NEVER bump G1/G2/G3 - they are correctness, not features
Prod/dev split done late	Real customers mixed with test data is unrecoverable embarrassment	It is Week 2, before any public URL exists; nothing customer-facing ships until it is done
Two-person bus factor during launch week	A stuck delivery at 8pm needs a human	Runbook + admin release/fail/refund tools already exist; agree who is on call which evenings
DLT/SMS not ready	Phone OTP breaks for real users	Soft-launch email+password only; enable phone OTP when DLT clears (login panel already supports both)

Source of truth: this PDF is a snapshot (14 Jul 2026). Live tracking stays in docs/PROGRESS.md; each finished task gets its entry via /finish-task as usual. Gap IDs (A1..D4, M1..M6, W1.1..W6.3) are stable - use them in branch names and PR titles.
